Bank Marketing Campaign Analysis

Executive summary | Guided Excel portfolio project

Prioritise controlled tests of follow-up practices and improve channel recording before changing campaign policy. The analysis identifies promising customer groups and contact patterns, but does not establish causal gains or financial returns.

Business question and method

Help the campaign manager decide whom to prioritise, how to review repeated contacts and what evidence is needed for channel choice. Analysed 4,521 UCI Bank Marketing records using data-quality checks, helper columns, seven PivotTables and an interactive Excel dashboard. Baseline totals and filter interactions were checked; unknown categories and documented special values were retained.

Records	Subscriptions	Conversion	Reported contacts
4,521	**521**	**11.52%**	**12,630**

Key findings

Previous success is a strong but narrow signal. Conversion was 64.34%, or 5.58 times the overall rate. This group generated 83 subscriptions from just 129 records, representing 2.85% of the sample.

Repeated contacts warrant review. The 6+ contact band accounted for 36.10% of reported contacts but only 6.53% of subscriptions, with 7.19% conversion. Harder-to-convert customers may have received more follow-up.

Channel comparisons depend on customer mix. Telephone and cellular converted at 14.62% and 14.36% overall, but the higher-converting channel differed by housing-loan status. Channel was unknown for 1,324 records, or 29.29% of the sample.

Recommended actions

The campaign manager should test prioritised follow-up for previously successful customers. Contact-centre operations should pilot a revised repeated-contact approach. The CRM data-quality lead should audit unknown channels and test improved recording. These are proposed tests, not demonstrated improvements.

Limits and next test

Historical associations, small groups and pooled month data limit causal and trend claims. Contact costs, deposit values, net margin and retention are missing, so profit and savings cannot be estimated. Randomly compare current and revised follow-up, measuring conversion, contacts and complaints over a common period. Request a power calculation and agree decision thresholds before selecting sample size.
